REINFORCEMENT LEARNING

DALL·E

OPTIMISATION

GRADIENT DESCENT

Desirable: A system that performs a specific task

The system has parameters that we need to select appropriately (optimise) for that task

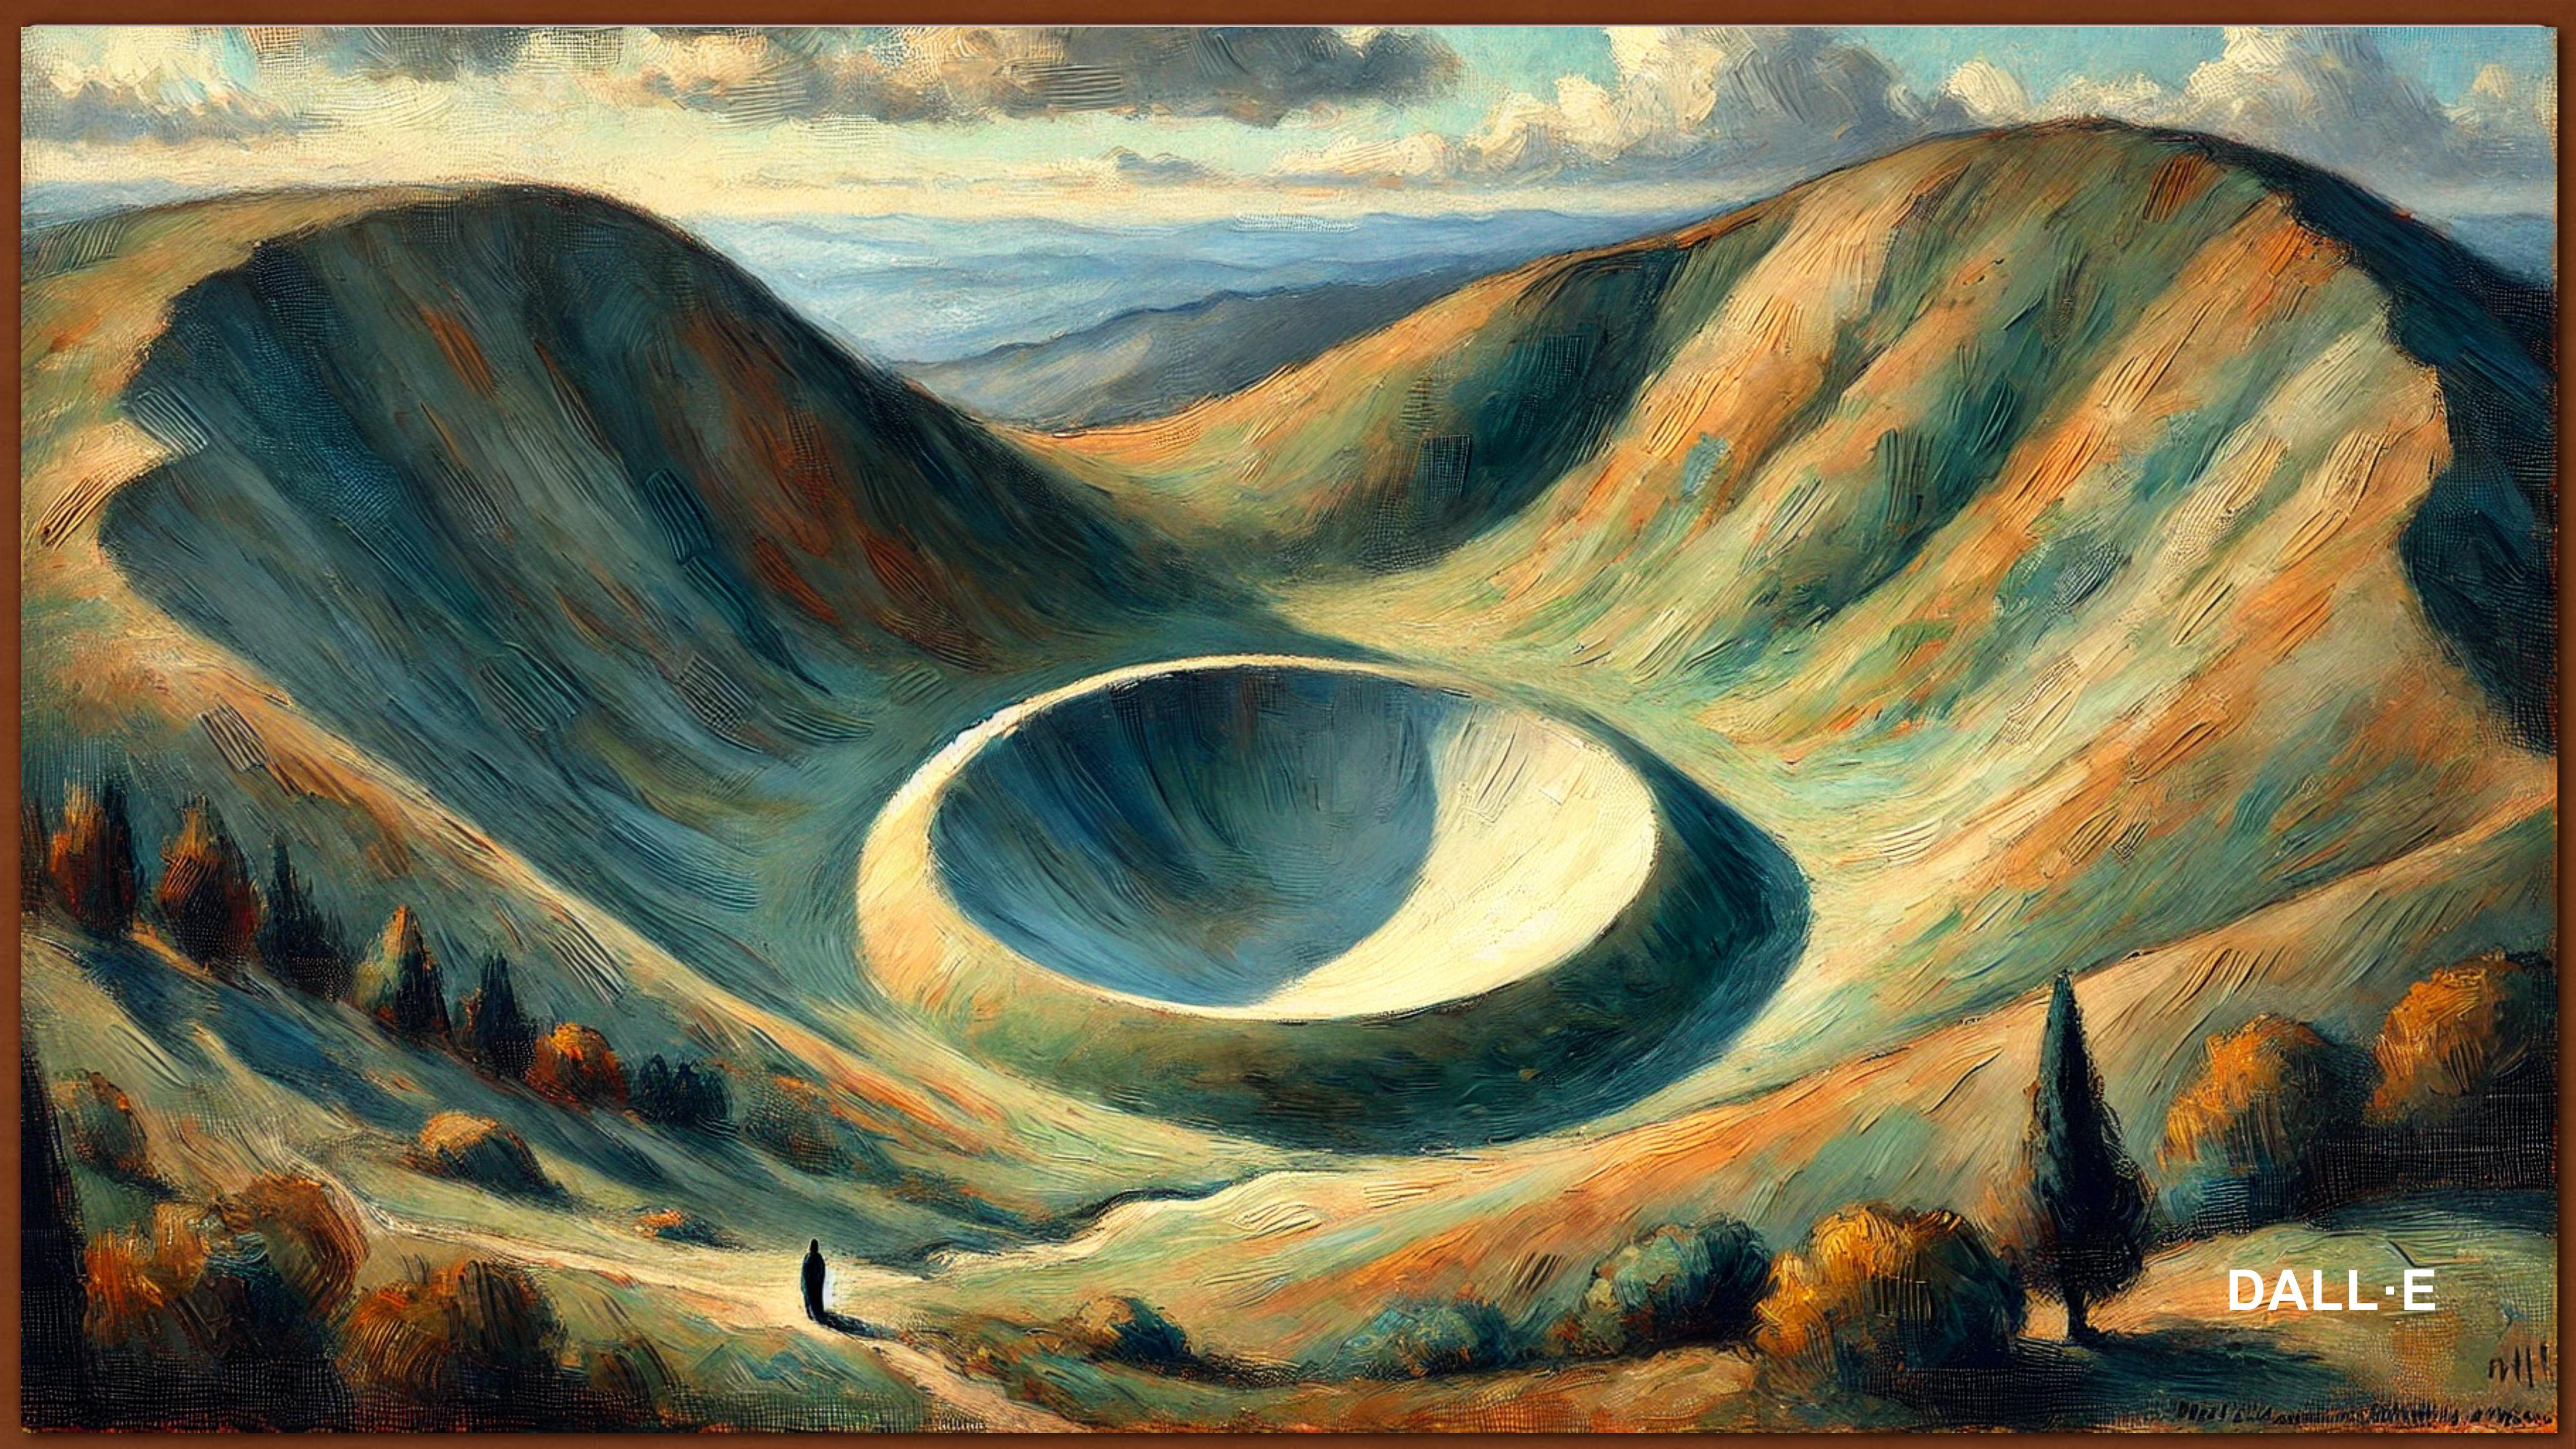

$f(x_1, x_2, \dots, x_n)$
parameters

f System's performance: maximise
System's error : minimise

OPTIMISATION

ARTIFICIAL NEURAL NETWORKS

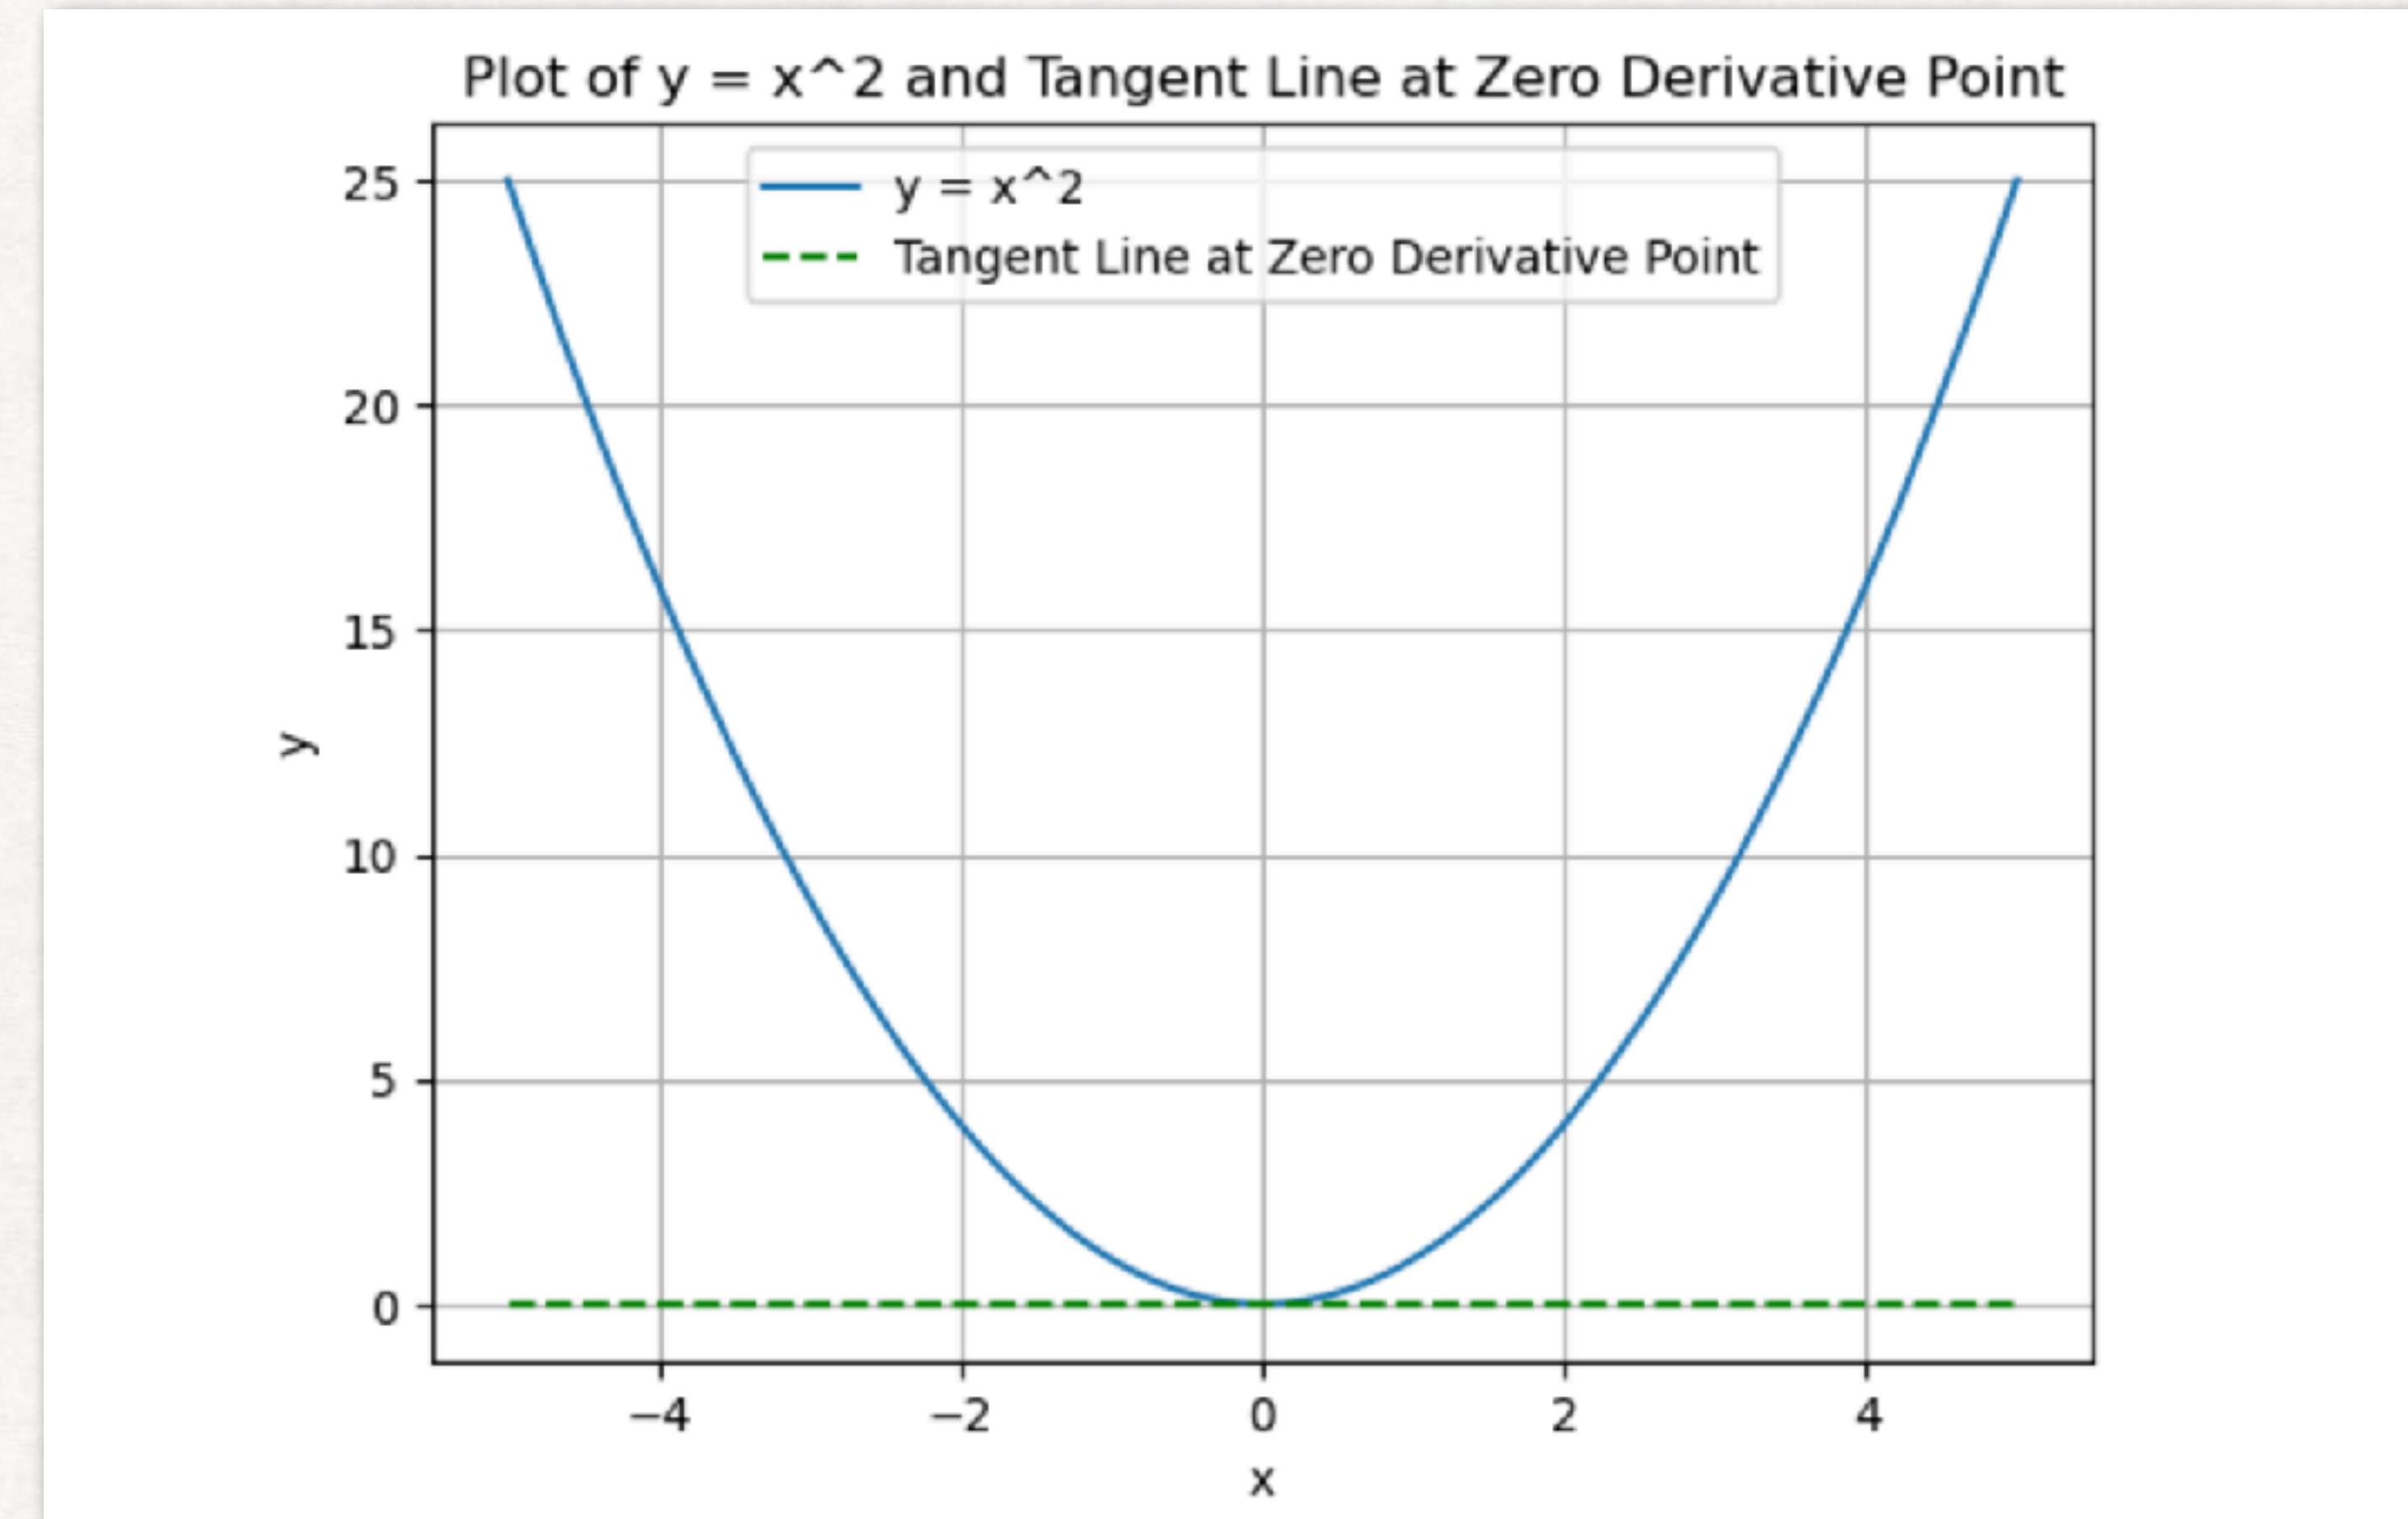

DALL·E

DERIVATIVES

OPTIMISATION - GRADIENT METHODS

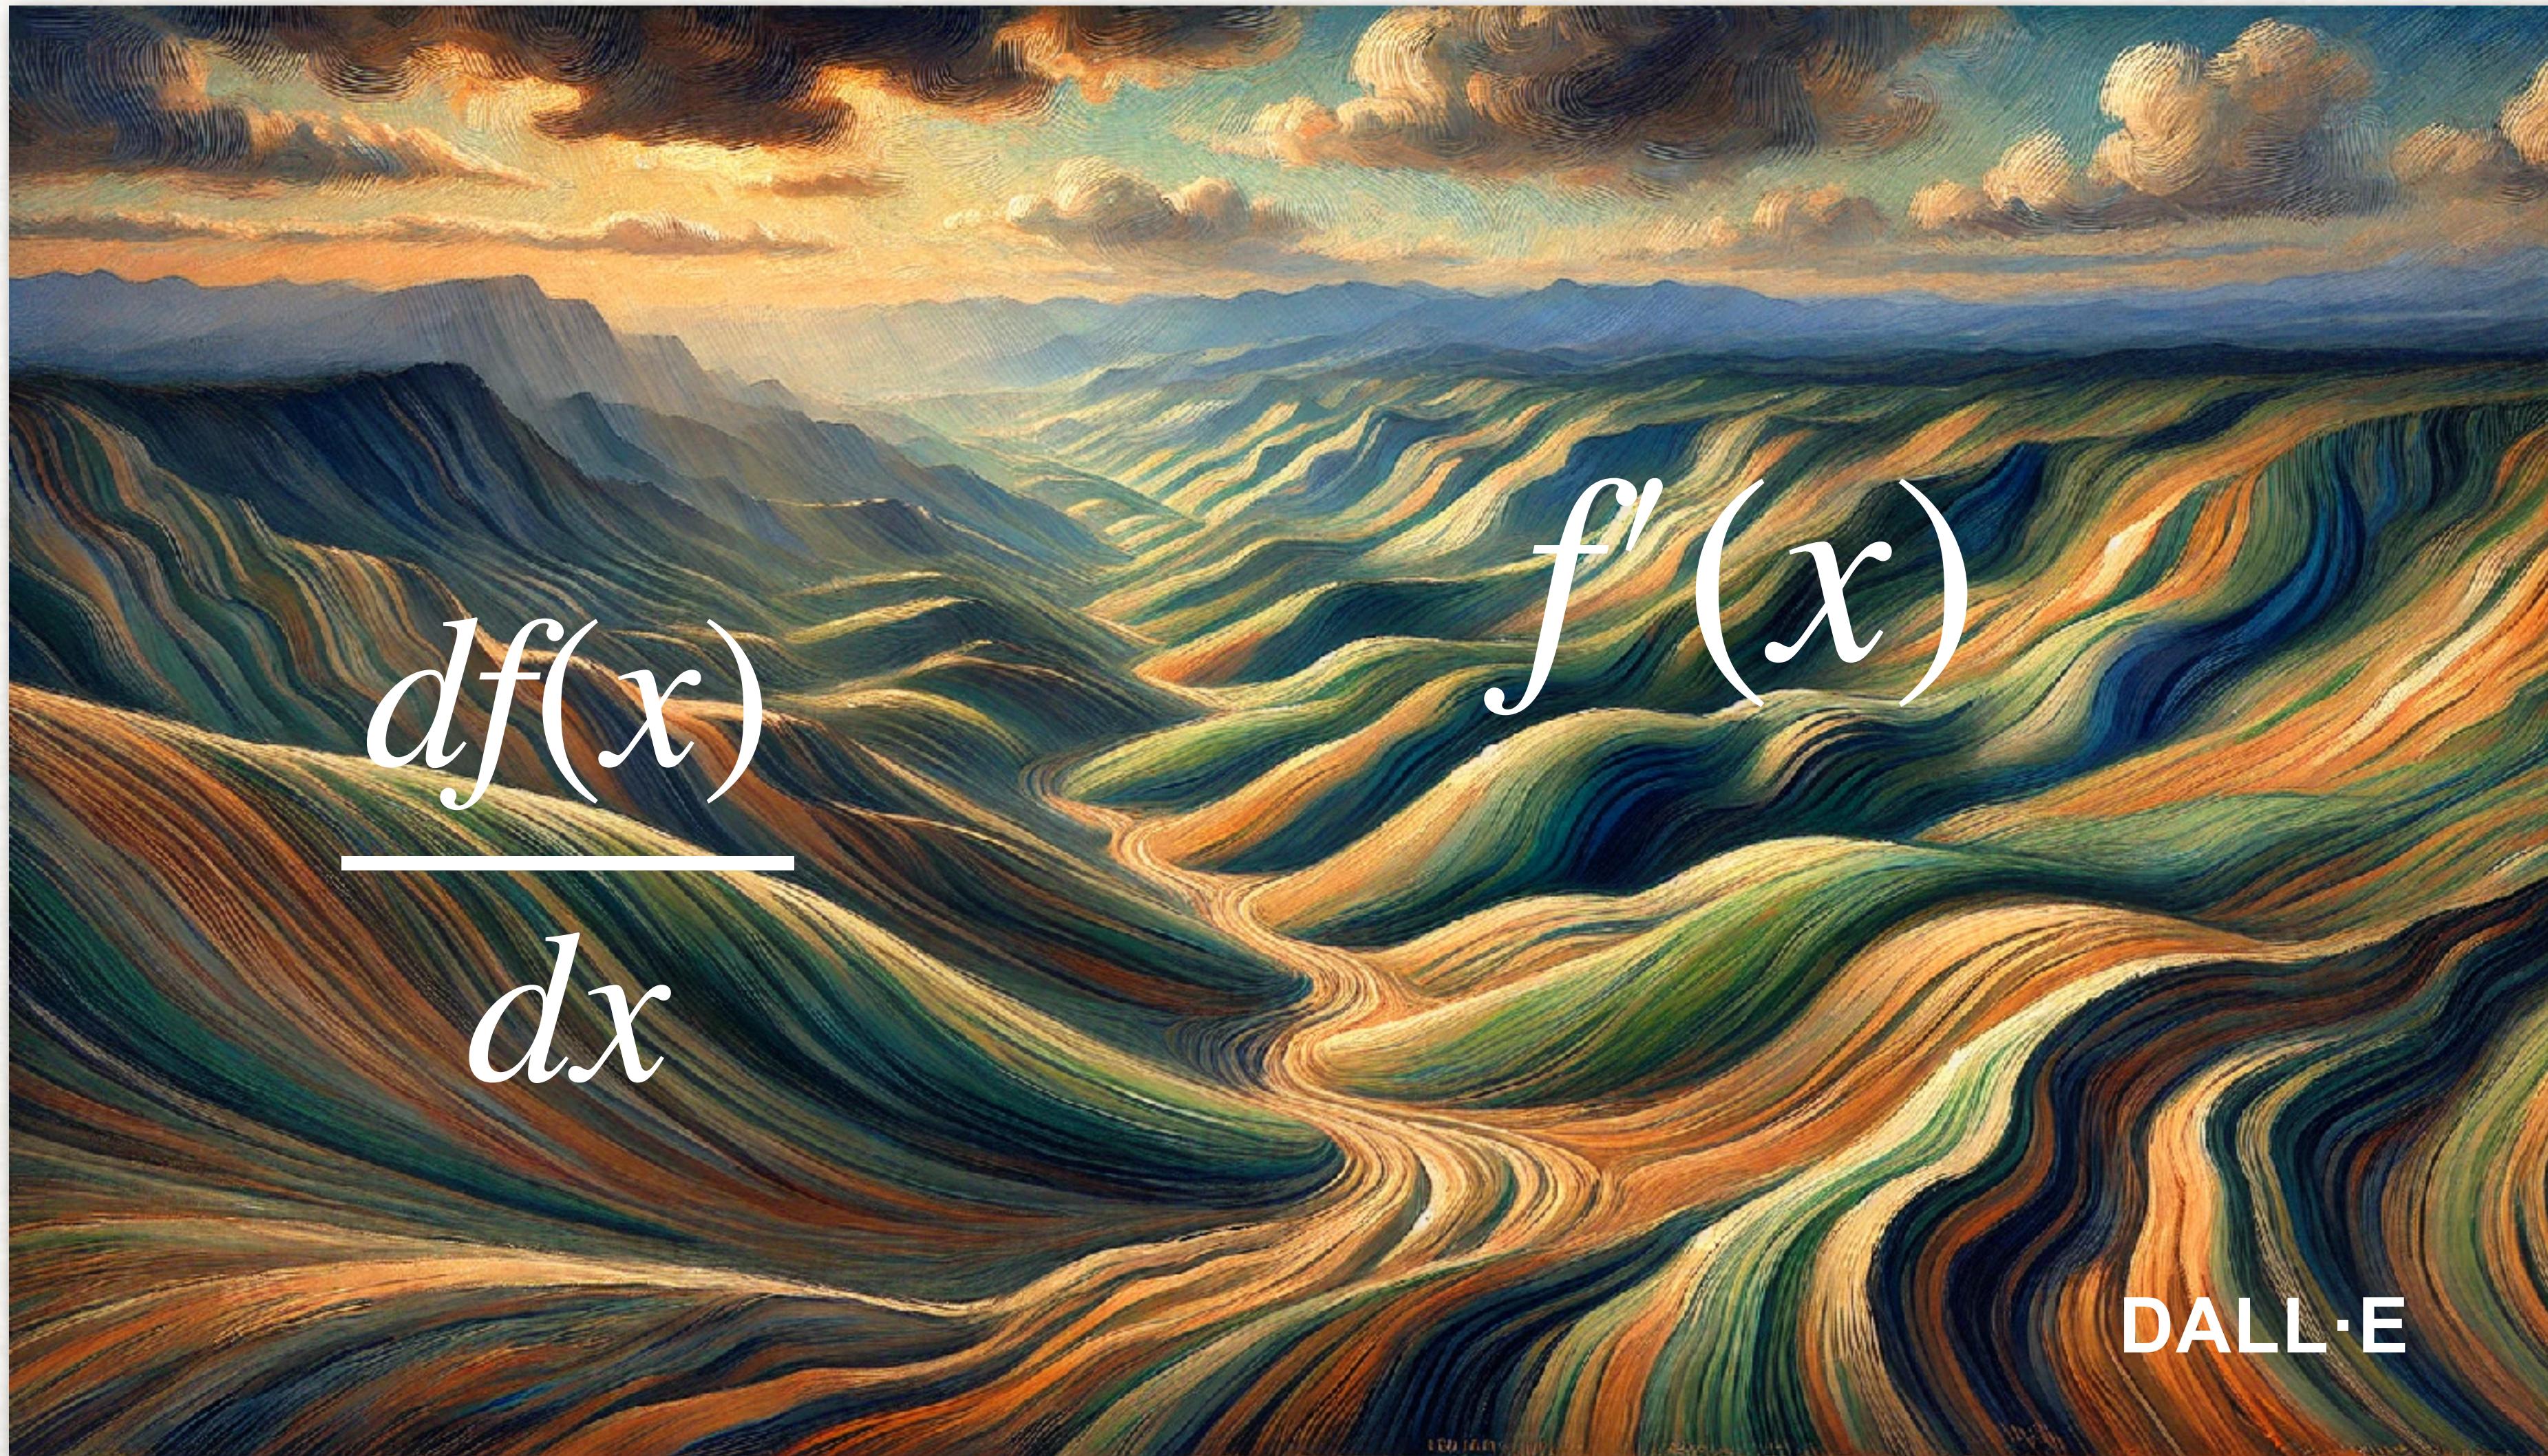

Slope

Error (Loss) function - Machine Learning

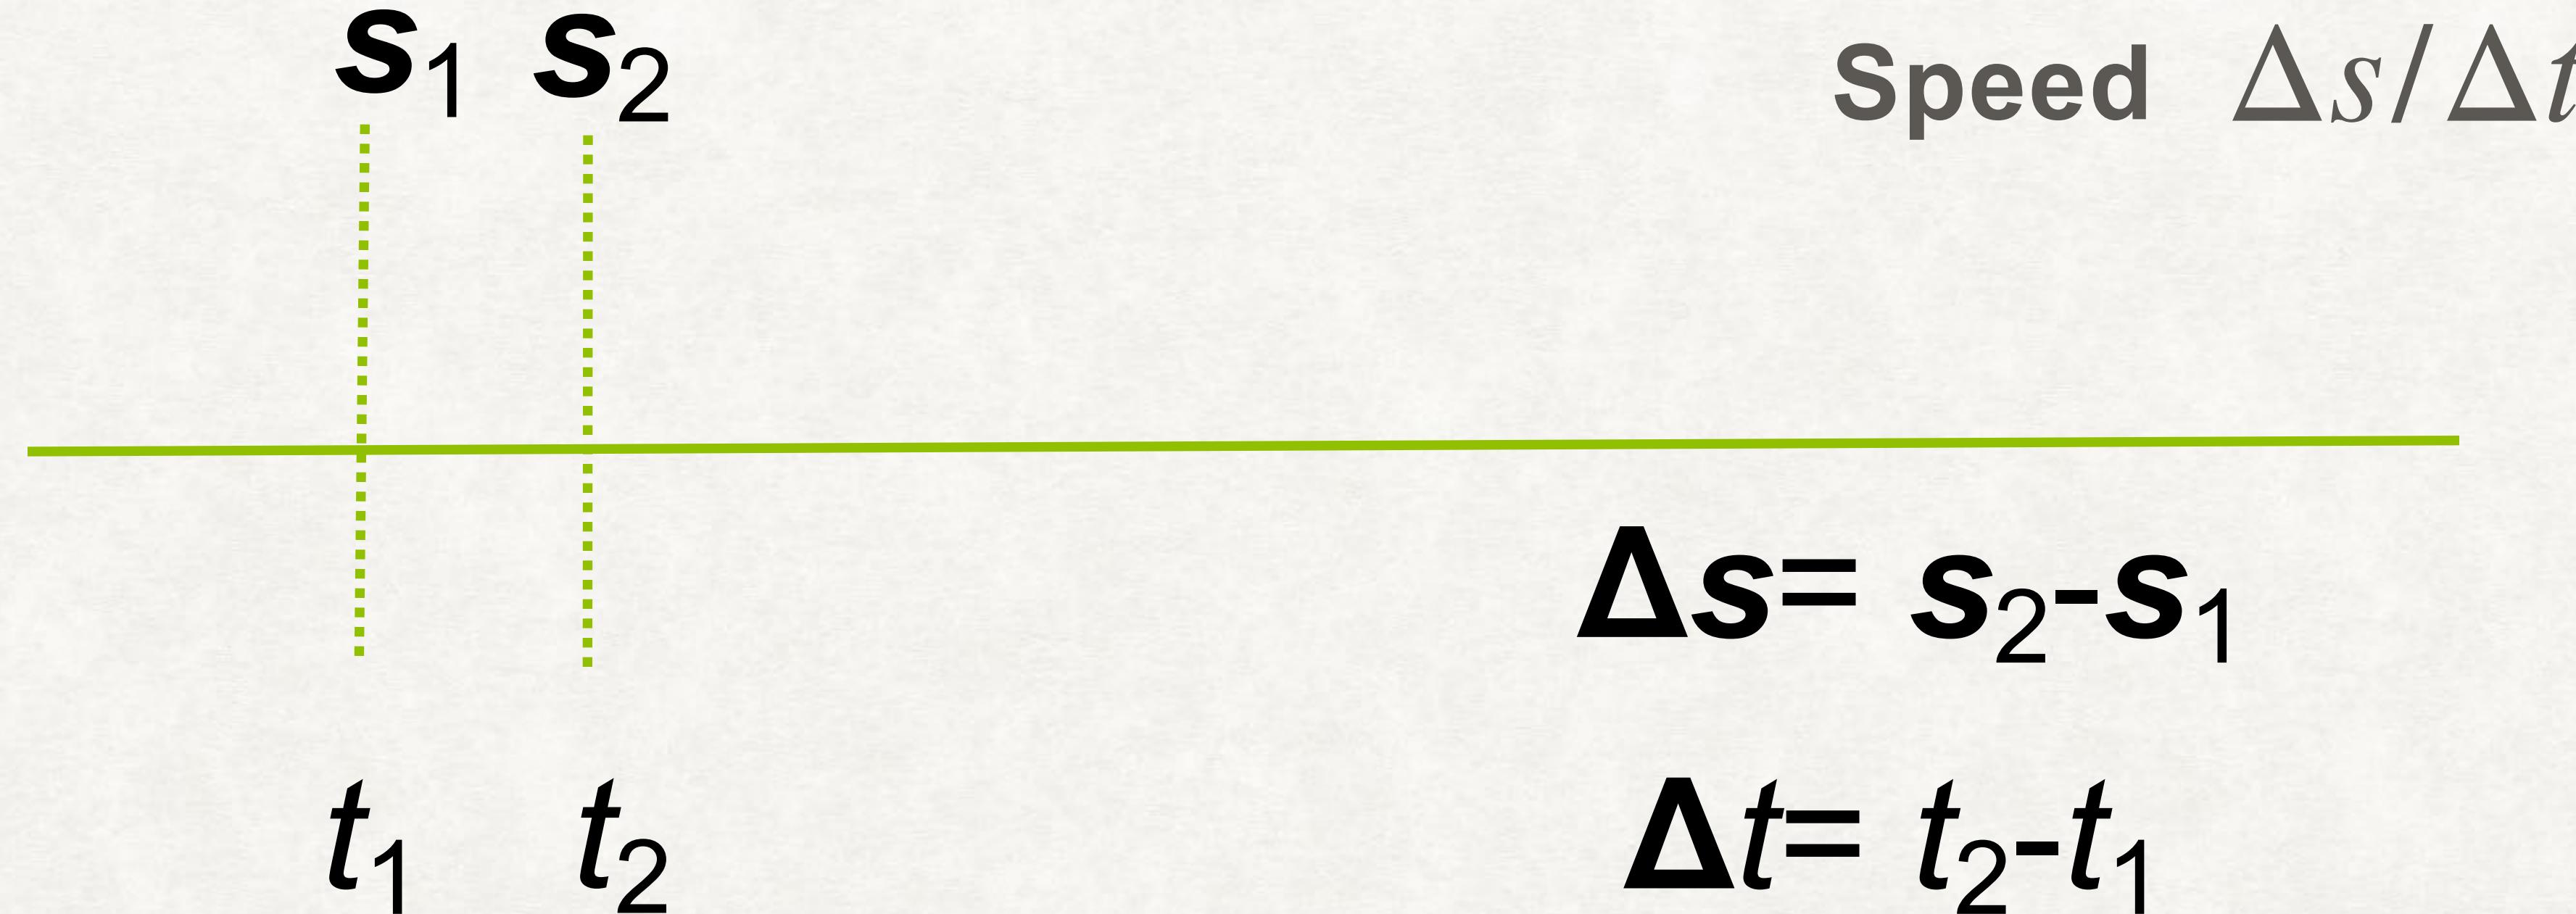

DERIVATIVES

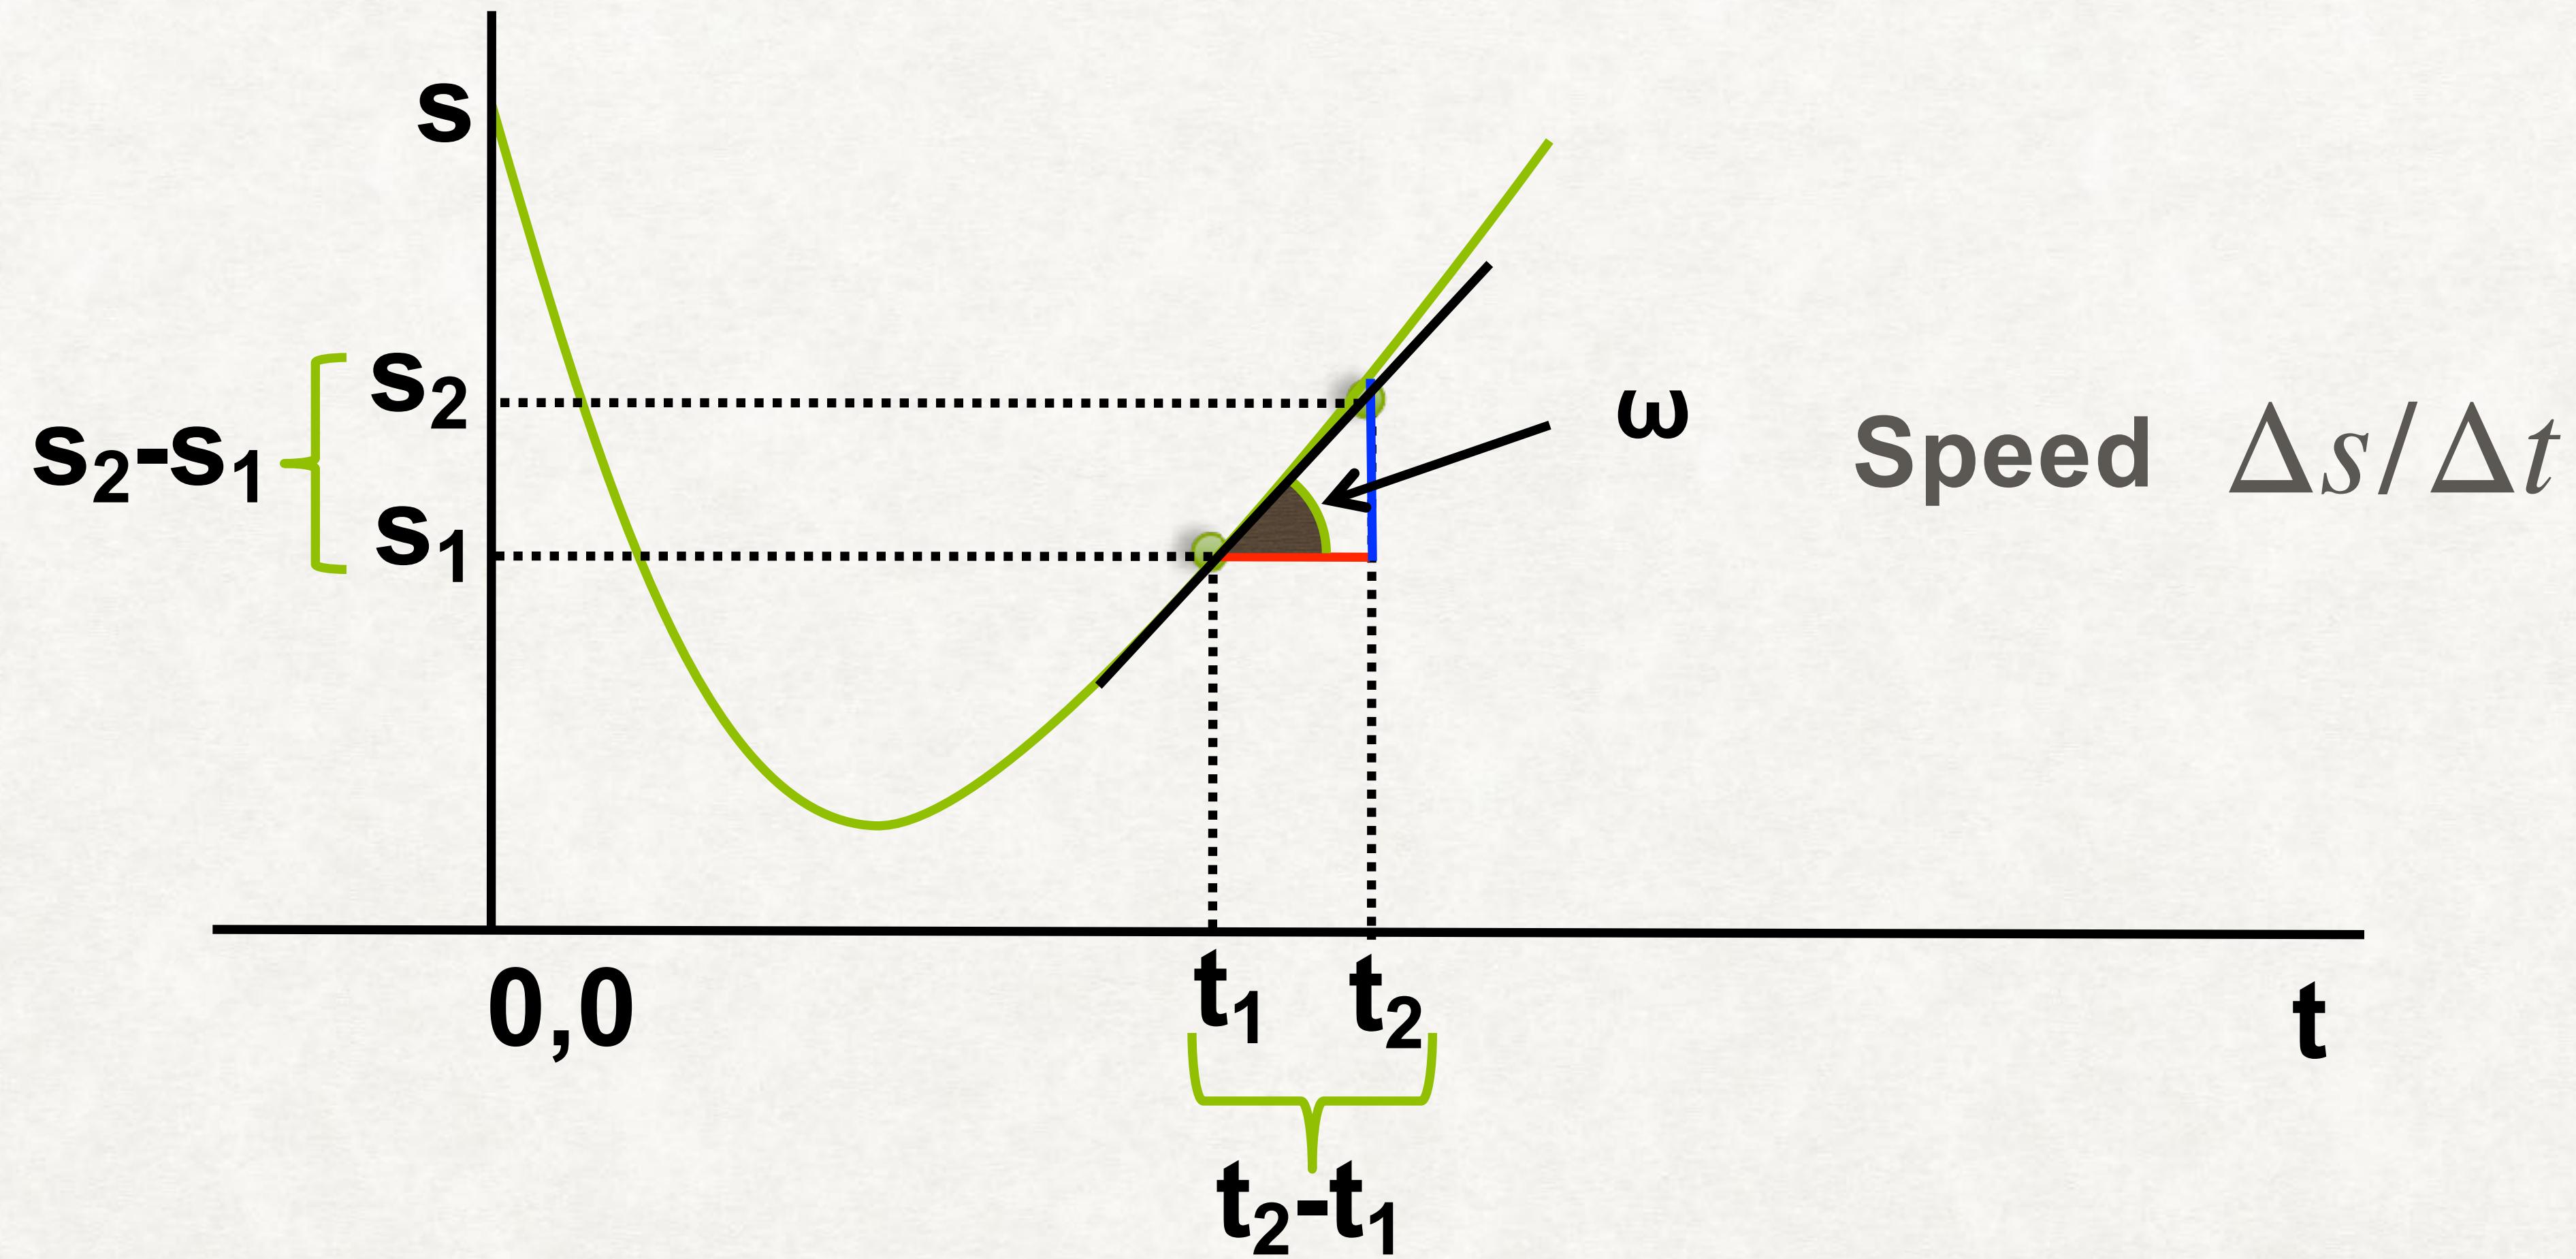

OPTIMISATION - GRADIENT METHODS

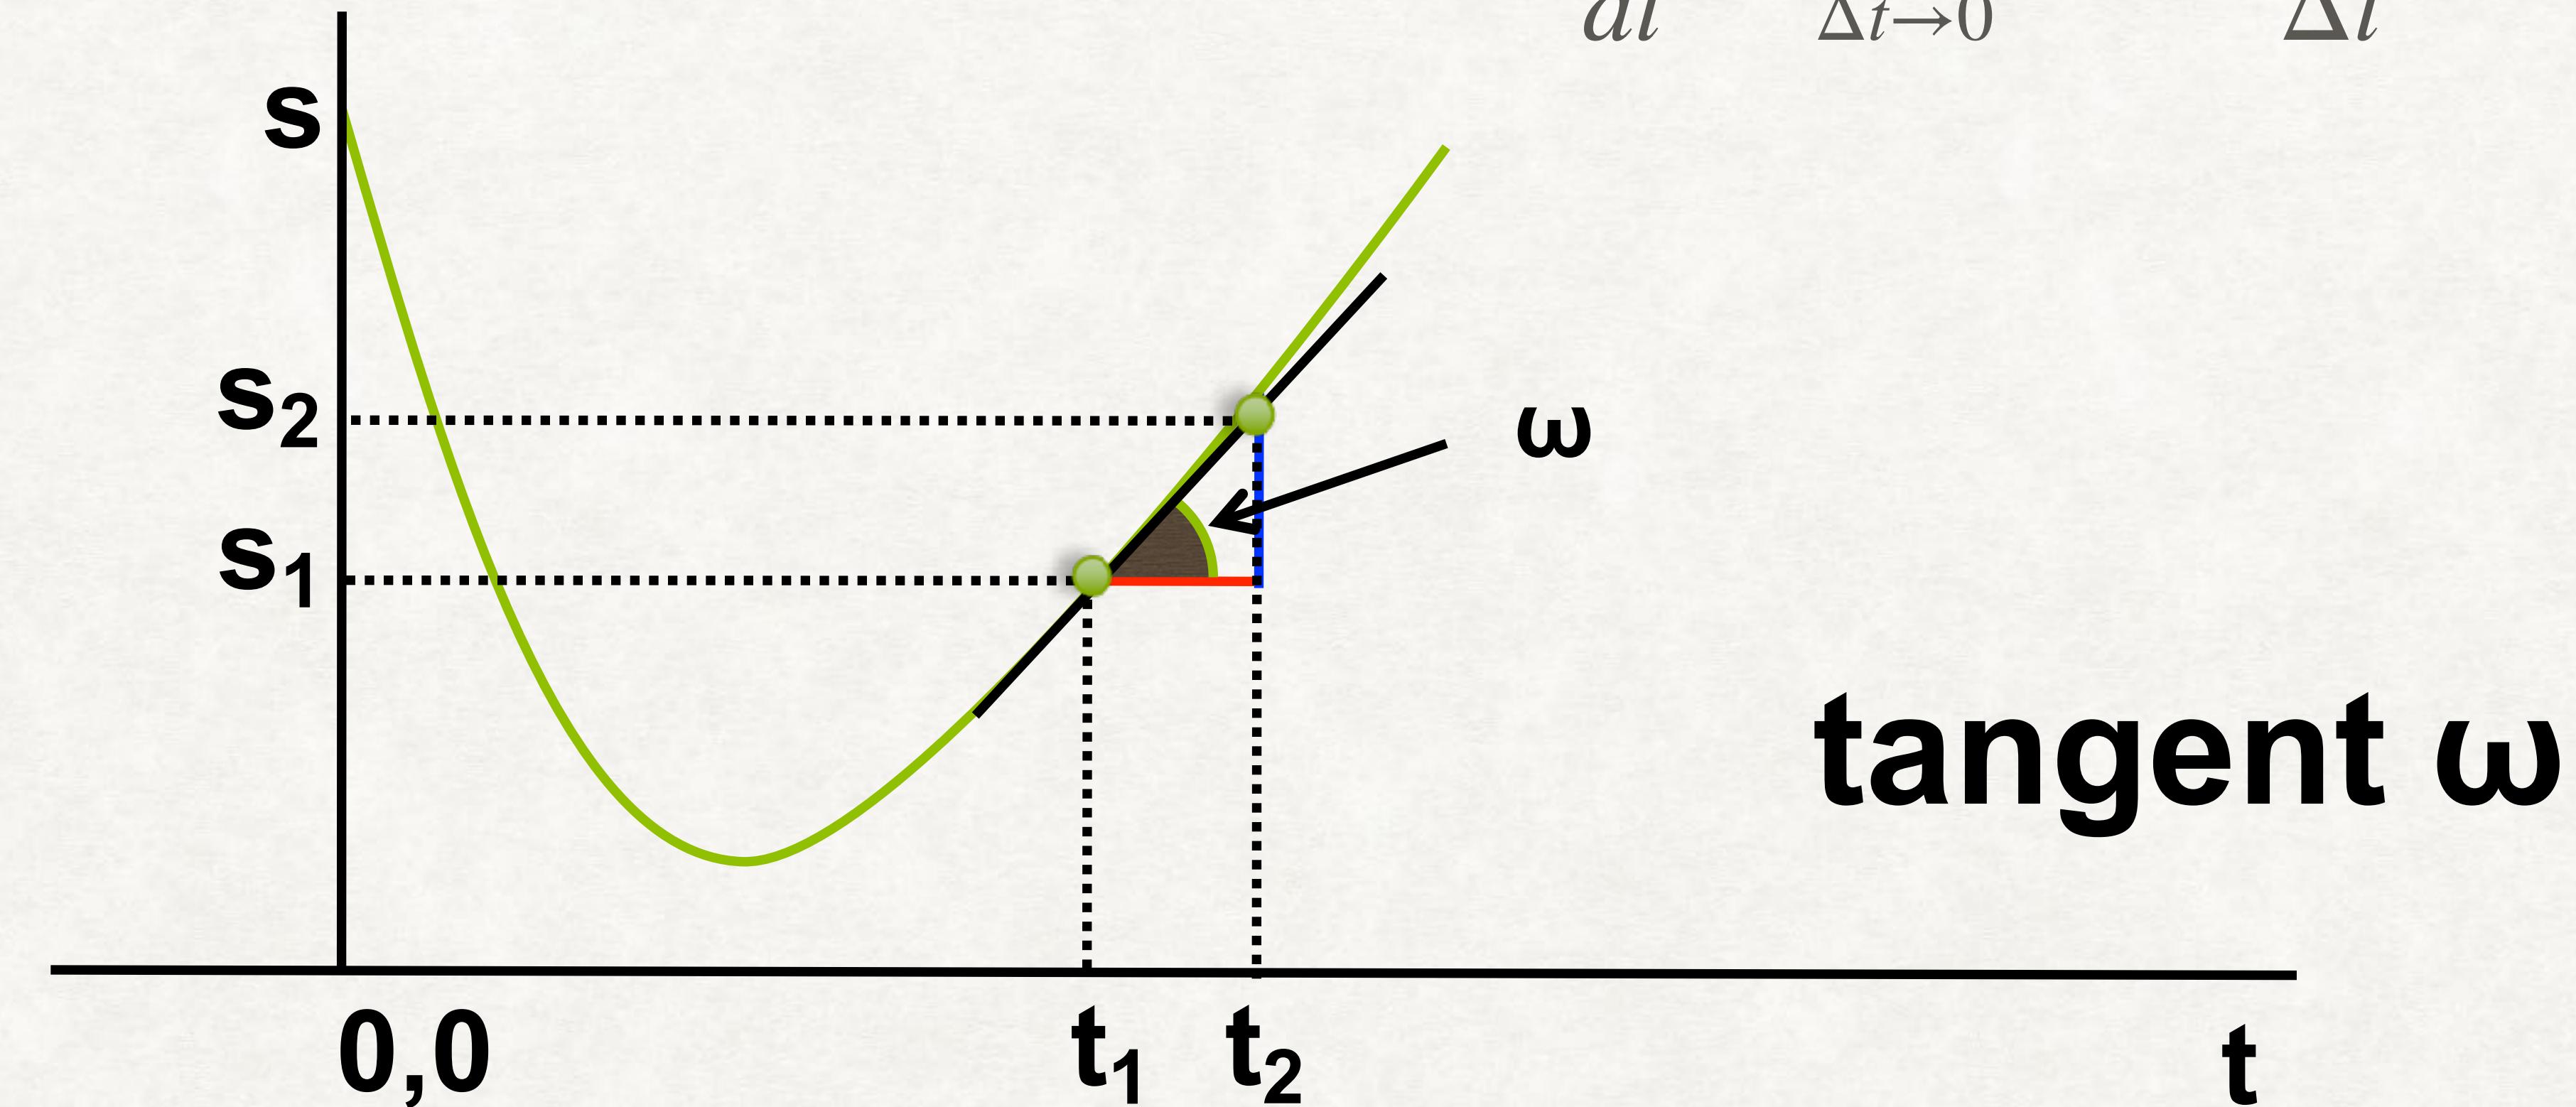

A painting of a landscape with a long line of dominoes in the foreground.

DALL·E

$$\frac{ds}{dt} = \lim_{\Delta t \rightarrow 0} \frac{s(t + \Delta t) - s(t)}{\Delta t}$$

DERIVATIVES

USE THE DEFINITION TO CALCULATE DERIVATIVES OF FUNCTIONS

More generally:

$$f'(x) = \frac{df}{dx} = \lim_{\Delta x \rightarrow 0} \frac{f(x + \Delta x) - f(x)}{\Delta x}$$

What is the effect of incrementing x by a small amount, Δx , on the value of $f(x)$?

$$f(x) = 7$$

$$f(x) = 7x$$

$$f(x) = 7x^2$$

DERIVATIVES IN PRACTICE

MEMORISE BASIC FUNCTIONS AND USE RULES

Power function: $f(x) = x^n$ $f'(x) = nx^{n-1}$

Exponential function: $f(x) = e^x$ $f'(x) = e^x$

Natural logarithm: $f(x) = \ln(x)$ $f'(x) = \frac{1}{x}$

DERIVATIVES - RULES

ADDITION

$$\frac{d}{dx} (f(x) + g(x)) = \frac{d}{dx} f(x) + \frac{d}{dx} g(x)$$

$$h(x) = x + x^2$$

DERIVATIVES - RULES

MULTIPLICATION

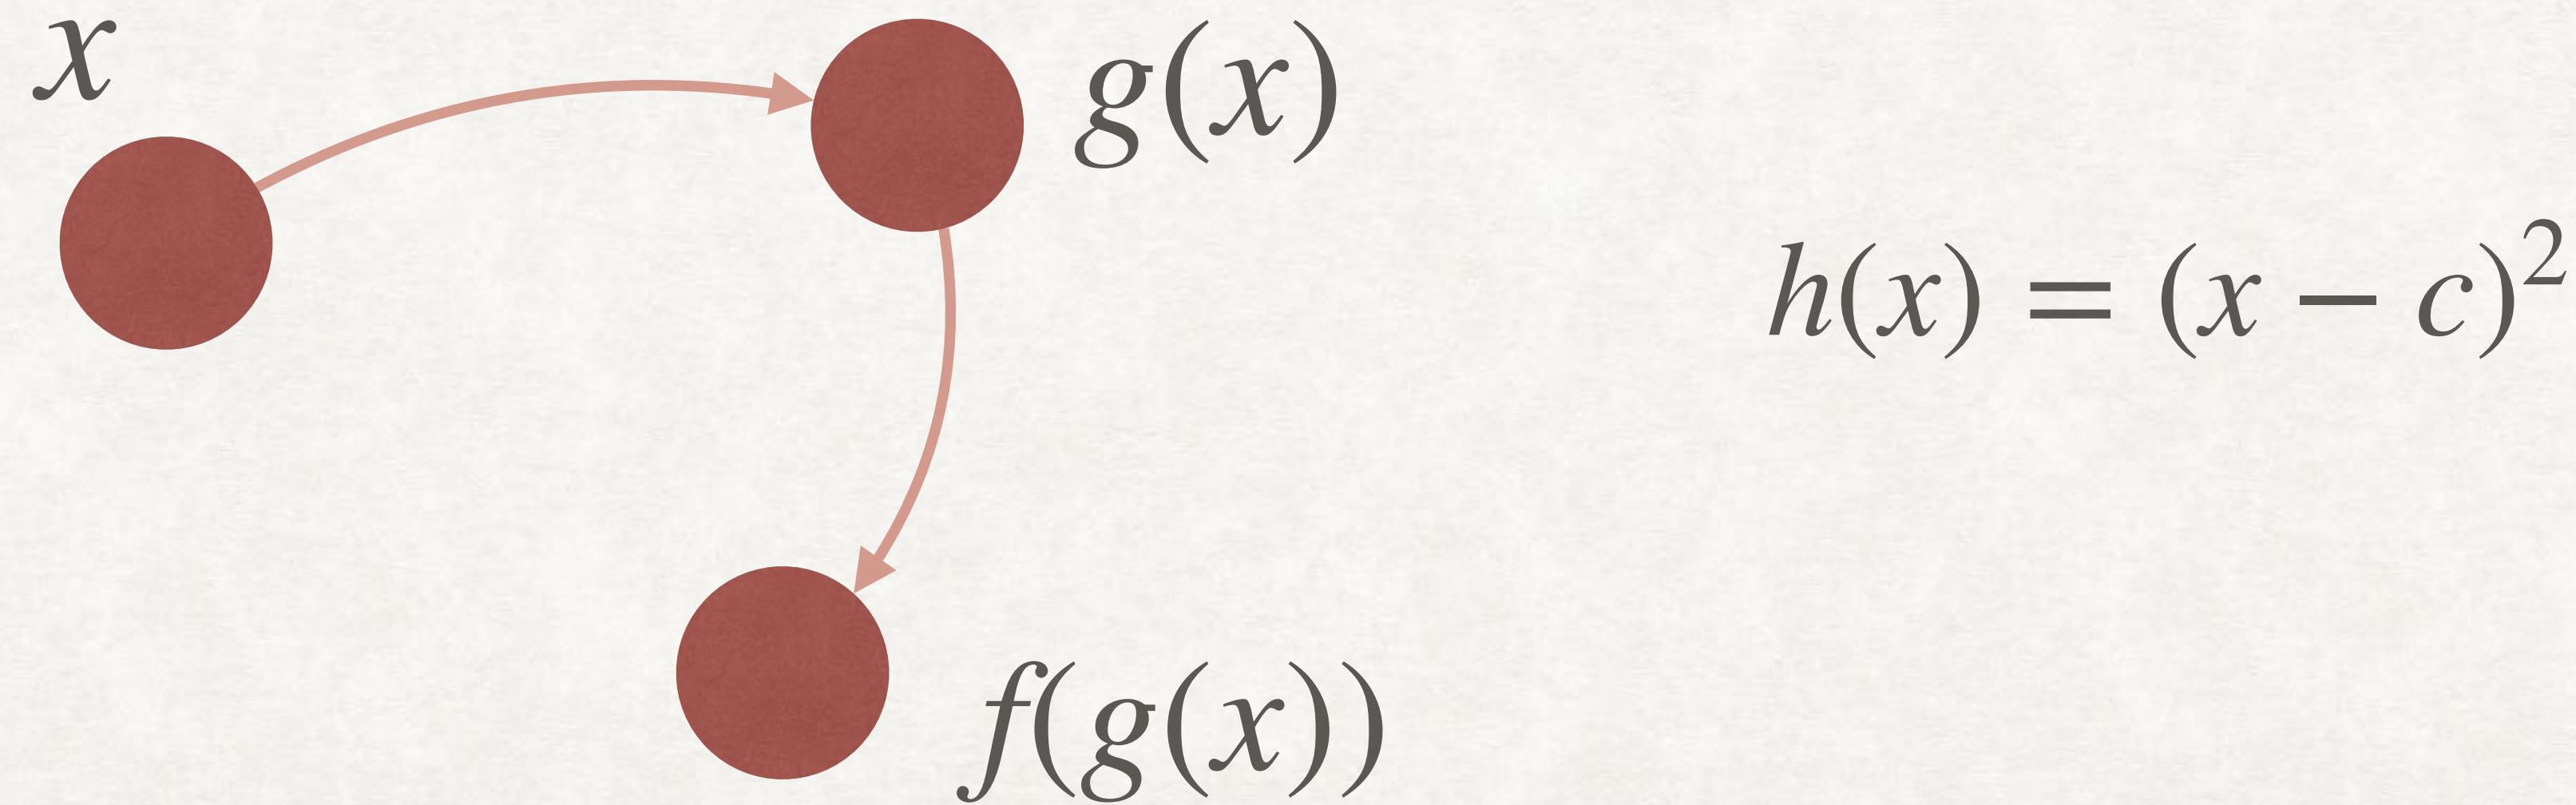

$$\frac{d}{dx} (f(x) \cdot g(x)) = \frac{df(x)}{dx} \cdot g(x) + f(x) \cdot \frac{dg(x)}{dx}$$

$$h(x) = x \cdot \ln(x)$$

DERIVATIVES - RULES

THE CHAIN RULE

$$\frac{df(g(x))}{dx} = \frac{df(g(x))}{dg(x)} \cdot \frac{dg(x)}{dx}$$

MOTIVATION FOR PARTIAL DERIVATIVES

LIGHTS AND BUTTONS PUZZLE

DALL·E

$$f(x, y) = x^2y + y^2$$

A more general way to
write the same:

$$f(x_1, x_2) = x_1^2x_2 + x_2^2$$

How do we estimate the gradient?

PARTIAL DERIVATIVES AND THE NABLA NOTATION

$f(x_1, x_2, \dots)$

$$\frac{\partial f}{\partial x_1} = \lim_{\Delta x_1 \rightarrow 0} \frac{f(x_1 + \Delta x_1, x_2, \dots) - f(x_1, x_2, \dots)}{\Delta x_1}$$

$$\nabla f = \left(\frac{\partial f}{\partial x_1}, \frac{\partial f}{\partial x_2} \right)$$

$$\frac{\partial f}{\partial x_2} = \lim_{\Delta x_2 \rightarrow 0} \frac{f(x_1, x_2 + \Delta x_2, \dots) - f(x_1, x_2, \dots)}{\Delta x_2}$$

PARTIAL DERIVATIVES AND THE NABLA NOTATION

One variable at the time, treat others as constants!

PARTIAL DERIVATIVES AND THE NABLA NOTATION

$$f(x_1, x_2) = x_1^2 x_2 + x_2^2$$

$$\frac{\partial f}{\partial x_1} = \frac{\partial}{\partial x_1}(x_1^2 x_2 + x_2^2) = 2x_1 x_2$$

$$\frac{\partial f}{\partial x_2} = \frac{\partial}{\partial x_2}(x_1^2 x_2 + x_2^2) = x_1^2 + 2x_2$$

INTRODUCE (PARTIAL) DIFFERENTIAL EQUATIONS

EVERYTHING CHANGES

$$F\left(x, y, \frac{dy}{dx}, \frac{d^2y}{dx^2}, \dots\right) = 0$$

Unknown: $y(x)$

$$F\left(x_1, x_2, \dots, x_n, u, \frac{\partial u}{\partial x_1}, \frac{\partial u}{\partial x_2}, \dots, \frac{\partial u}{\partial x_n}\right) = 0$$

$u(x_1, x_2, \dots)$

DIFFERENTIAL EQUATIONS

RELAXATION

$$\tau \frac{dx(t)}{dt} = -x(t)$$

$x(t)$: here it is a function of time $f(t) = x(t)$; not a variable!

τ : time constant, if a large value you relax slow (you have a long memory:)

DIFFERENTIAL EQUATIONS

LEAKY INTEGRATOR

$$\tau \frac{dx(t)}{dt} = -x(t) + s(t)$$

$x(t)$: a function

$s(t)$: sample, input

t : variable

DALL·E

DEFINITION OF DERIVATIVES AND ITS APPLICATION TO DIFFERENTIAL EQUATIONS

$$\frac{dx(t)}{dt} = \lim_{\Delta t \rightarrow 0} \frac{x(t + \Delta t) - x(t)}{\Delta t}$$

Approximate the derivative as difference.

$$\tau \frac{dx(t)}{dt} = -x(t) + s(t)$$

You need one initial point and a time step.

e.g., $x(0), \Delta t = 0.1$ (seconds)

Its discrete form is known as “exponential moving average”

DEFINITION OF DERIVATIVES AND ITS APPLICATION TO DIFFERENTIAL EQUATIONS

$$\frac{dx(t)}{dt} \approx \frac{x(t + \Delta t) - x(t)}{\Delta t}$$

Approximate the derivative as difference.

$$\tau \frac{x(t + \Delta t) - x(t)}{\Delta t} = -x(t) + s(t)$$

You need one initial point and a time step.

e.g., $x(0), \Delta t = 0.1$ (seconds)

Its discrete form is known as “exponential moving average”

DEFINITION OF DERIVATIVES AND ITS APPLICATION TO DIFFERENTIAL EQUATIONS

$$x(t + \Delta t) - x(t) = \frac{\Delta t}{\tau} (-x(t) + s(t))$$

Only unknown!

e.g. $x(t = 0)$, $\Delta t = 0.1$ (seconds)

Euler's method: I can start from, e.g. time 0 (sec)
and iteratively calculate the value of x at any time

DEFINITION OF DERIVATIVES AND ITS APPLICATION TO DIFFERENTIAL EQUATIONS

$$x(t + \Delta t) = x(t) + \frac{\Delta t}{\tau} (-x(t) + s(t))$$

e.g. $x(t = 0)$, $\Delta t = 0.1$ (seconds)

Useful equation for “forgetful” averaging, filtering high frequencies (noise)

DEFINITION OF DERIVATIVES AND ITS APPLICATION TO DIFFERENTIAL EQUATIONS

$$\tau \frac{d\mathbf{w}(t)}{dt} = - \frac{\partial \mathcal{L}(t)}{\partial \mathbf{w}(t)}$$

$$\Delta \mathbf{w}(t) = - \eta \frac{\partial \mathcal{L}(t)}{\partial \mathbf{w}(t)}$$

η : learning rate

SUMMARY

PREREQUISITES

- Concept of Optimisation, Gradient Learning
- Derivatives & partial derivatives
- Differential equations, Euler's method & leaky integrators

WARNING!

GENERATIVE AI AND THEORY

Unless specialised in maths and reasoning, answers to questions regarding theory might be wrong!

Safe to use in programming because it is possible to test the answer.
